DRIVER AIRBAG TEST

An **airbag** is a [vehicle safety](#) device. It is an occupant restraint consisting of a flexible envelope designed to inflate rapidly during an automobile [collision](#), to prevent occupants from striking interior objects such as the steering wheel or a window. Modern [vehicles](#) may contain multiple airbags in various side and frontal locations of the passenger seating positions, and sensors may deploy one or more airbags in an impact zone at variable rates based on the type and severity of impact; the airbag is designed to only inflate in moderate to severe frontal crashes. Airbags are normally designed with the intention of supplementing the protection of an occupant who is correctly restrained with a [seatbelt](#). Most designs are inflated through [pyrotechnic](#) means and can only be operated once.
